The present invention is directed toward a stove and, more particularly, to a manually actuated stove constructed from a stack of sheets of steel and having controls thereon for selectively operating the stove and other functions. There have been a number of stoves of the type constructed from stacked sheets of steel or other metal and having control elements thereon for effecting the cooking, heating, or other processes with the stove. The various prior art stoves require that at least a portion of the stove be in the open, usually with doors and the like for covering or uncovering the elements on the stove. This type of construction allows the stove to be touched and operated when it is outdoors or otherwise not covered by the aforementioned doors and the like. In addition, the prior stoves are generally not very attractive and, in many instances, are difficult to manufacture with precision control of the various components. For this reason, among others, there has been a need for a stove of the type constructed from a stack of sheets of steel and having control elements thereon for selectively operating the stove and other functions. Preferably, the stove is provided in a compact package to minimize its size and, thus, maximize its versatility in providing a compact, efficient heating source.

Yes, I'd love a Linux or Mac version that just runs like shit on Windows and is even a little better in terms of native apps, but for what it's worth on a brand new PC or laptop, this really isn't bad. ~~~ nevi-me Yes, it doesn't run very smoothly on the
